EDUCATION

Software Engineering
Semicolon Africa

CORE SKILLS

- Java / Spring Boot
- System Architecture
- Python / Django
- RESTful API Design
- PostgreSQL / MongoDB
- React / JavaScript
- Docker / DevOps
- C++
- Html/css
- React Native

PROFESSIONAL SUMMARY

Backend-focused Software Engineer with strong experience designing and building scalable, production-ready applications using Java Spring Boot and Python. Specialises in microservices architecture, event-driven systems, and modular monolith design with clean separation of concerns for future scalability. Proficient in translating complex business requirements into well-structured systems using domain events, loose coupling, and layered architecture patterns. Experienced in RESTful API design, JWT-based security, JPA/Hibernate, Docker containerisation, and third-party integrations including payment APIs and SMTP services.

EXPERIENCE

Independent Backend Developer

Independent Backend Developer

2023 – Present | Remote

Project-Based - Remote

- Designed and implemented a production-grade modular monolith (FarmSphere) using Java Spring Boot 3.x with Maven multi-module architecture, applying microservices-ready design patterns from day one.
- Architected an event-driven system using Spring Application EventPublisher with domain events across 8 independent modules — identity, estate, farming, tool, marketplace, investment, notification, and wallet — with zero inter-module coupling.
- Implemented JWT-based authentication and role-based access control (BUYER, FARMER, INVESTOR, ADMIN) with multi-role user support, custom security filters, and a global exception handler returning consistent API responses.
- Built a tokenised investment platform with primary and secondary token markets, proportional ROI distribution calculated from real crop yield data, and Paystack API wallet integration for investor payouts.
- Implemented API Gateway pattern with JWT validation, user context forwarding via headers, and route-based service discovery — architected for migration to Eureka- backed microservices.
- Dockerised the full application using multi-stage builds and Docker Compose with PostgreSQL, deploying to Render with environment-variable-driven configuration.
- Designed and documented all APIs using Swagger / OpenAPI 3.0 with Bearer token authentication, operation descriptions, and response schemas.
- Built backend systems for advertisement platforms, transport management systems, and government vehicle registration and ticketing applications using Java Spring Boot and Python Django.

TECHNOLOGIES

- Spring Boot 3.x / Spring Security
- JWT Authentication
- Spring Data JPA / Hibernate
- Maven Multi-Module Projects
- Docker & Docker Compose
- PostgreSQL/H2
- MongoDB
- Paystack API Integration
- JavaMailSender / SMTP
- Swagger / OpenAPI 3.0
- Git/GitHub
- IntelliJ IDEA/ VS Code

SOFT SKILLS

- Problem-solving
- System Design Thinking
- Attention to Detail
- Adaptability
- Continuous Learning
- Teamwork

LANGUAGES

English

— Fluent

Yoruba

— Native

PROJECTS

FarmSphere — Agricultural Investment & Farm Management Platform

FEATURED

End-to-end agri-tech platform serving Farmers, Investors, Buyers, and Admin. Features include farm estate management (estate → cluster → plot hierarchy), crop plan creation with intercropping support, farm cycle tracking, tool booking with admin approval workflows, a produce marketplace with order matching, a tokenised investment engine with secondary market trading, and proportional ROI distribution calculated from real harvest yield data. Built as a loosely coupled modular monolith designed for microservices migration.

- Java 21
- Spring Boot 3.x
- Maven Multi-Module
- PostgreSQL
- Spring Security + JWT
- Docker
- Event-Driven Architecture
- Paystack API
- Swagger / OpenAPI
- JavaMailSender / SMTP

Classified Ad System

SOLO

Full-stack advertisement platform built from scratch. Implemented backend services and connected them to a React/Vite frontend.

- Spring Boot
- MongoDB
- React
- Vite
- JavaScript

URL Shortener System

SOLO

URL shortening service supporting redirection, persistence, and efficient URL mapping.

- Spring Boot
- MongoDB

Transport Management System

SOLO

Backend system managing truck transportation operations including driver registration, trip assignment, truck allocation, and trip calculation per driver.

- Spring Boot
- SQL
- REST API

Vehicle Registration & Ticketing System

COLLABORATION

Government-focused application for road safety agencies. Implemented vehicle registration, ticket booking, ticket settlement, and reporting features.

- Java
- Python
- SQL
- Django

ARCHITECTURE

- Microservices
- Event-Driven
- Modular Monolith
- Layered Architecture
- Domain Events
- Loose Coupling
- Port & Adapter
- SOLID Principles
